                                         /note-"Organ: colon; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Plasmid DNA from the normalized library NCI_CGAP_CO10 was prepared, and so circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs (rom a pool of 5,000 clones made from the same library (cloneIDS 1057416-106125, and 1144584-14535)).

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was FCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1469064-1470983, and 147592-147643). Subtraction by Bento Soares and M. Fatima Bonaldo. "

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1479064-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo.

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTS2 gene ORF T00745 (which encodes R81702). The above assay can also be used in the diagnosis and prognosis of malanoma, lymphoma, leukaemia and pancreas, breast and thyroid cancers, etc. .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The CDNA sequences encoding several multiple tumour suppressor (MTS) polypeptides have been isolated and sequenced. This sequence encodes the MTS polypeptide encoding cDNAs and murants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS cDNAs can be used for diagnosing predisposition to melanoma, leukemia, astrocycoma, allohastoma, lymphoma, glioma, hedgkin's lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg, an altered MTS gene are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wild-type multiple tumour suppressor (MTS) gene and mutant sequences - useful in diagnosis, prognosis and therapy of human cancer, e.g. melanoma or leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-MAY-1996 (first entry)

Human multiple tumour suppressor polypeptide, MTS2 encoding cDNA.

Multiple tumour suppressor; El-alpha; diagnosis; cancer; leukaemia; astrocytoma; glioblastoma; Hodgkin's lymphoma; melanoma; glioma; gene therapy; chronic; ds.

Homo sapiens.

PT Useful for the diagnosis of cancers related to MTSIE1-beta

PT mutation(s) and their treatment

PT mutation(s) and their treatment

Disclosure; Fig 11; 72pp; English.

CC MTS2. The MTS gene locus is also referred to as the familial melanoma

CC MTS2. The MTS gene locus, located on human chromosome 9p21. Germ line mutations

CC (MLM) genes can be used in the diagnosis of predisposition to cancers,

CC e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma,

CC Godkii's lymphoma, CLL, and cancers of the pancreas, breast, thyroid,

CC ovary, uterus, testis, kidney, stomach and rectum.

This is the nuclectide sequence of the multiple tumour suppressor

This is the nuclectide sequence of the invention. The MTS gene
(MTSIEIS) gene, used in the method of the invention. The MTS gene
(MTSIEIS) gene, used in the method of the invention.

This is useful in the diagnosis and prognosis of human cancer, e.g. by
standard nucleic hybridisation techniques, of patient samples. The
mutated sequences are those that are present in somatic mutations
of the gene in cancers. The vectors can be used for gene therapy
strategies to replace function of mutated protein in patients. These
can also be used to construct protein minetics, also for therapoutic
strategies. In addition the expression constructs can also be used
for recombinant production of MTS. Recombinant MTS can be used to
screen for drugs to be used for cancer therapy, and the protein
screen for drugs to be used to restore MTS function in a cell.

C Claim 43: Page 78: 109pp; Enquish.
C CDNA (T02963) coding for the human cell-cycle regulatory (CCR)
protein pis (R85117) was identified in immunopracipitates of
transforming growth factor. The isolated cDNA can be used: to
detect mutations in CCR genes that lead to cell proliferation;
C cob preed transgent animals to study cellular disorders involving

CDNA (102964) coding for the mouse cell-cycle regulatory (CCR) protein p15 (R85118) was isolated from an embryonal carcinomal library using a probe based on a mouse CCR p13;5 cDNA (T02965). The isolated cDNA can be used: to detect mutations in CCR genes that lead to cell proliferation; to breed transgenic animals to study cellular disorders involving CCR allele.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mutation/misexpression; and to correct CCR-deficient cells (gene therapy). Example 7; Fig 18; 80pp; English.

The present sequence encodes mouse multiple tumour suppressor (MTS2) gene. The MTS1 gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.

Claim 60; Page 83-84; 88pp: English.

Comprision system (A) that complexes. It provides a recombinant transfection system (A) that comprises: (1) first gene construct comprision a sequence encoding an inhibitory polypeptide containing at least one CDK binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (1) second gene construct comprising a sequence encoding a polypeptide that to promotes endothelialisation, and (11) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are nucleic consists encoding a fusion protein (FP) containing: (1) a therapeutic collusar process when FP enters the cell, and (11) a transcellular collular process when FP enters the cell, and (11) a transcellular consists of at least one CDK-binding motif and a TCP. See X26220 for consists of at least one CDK-binding mutif and a TCP. See X26210 for sequence represents a DNA encoding a human truncated p27/pl6 fusion
Fusion and chimaeric proteins including cyclin-dependent kinase binding motif - used for regulation of cell proliferation and differentiation, for treatment of, e.g. vascular injury, cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ë

Fusion and chimaeric proteins including cyclin-dependent kinase binding motif - used for regulation of cell proliferation and differentiation, for treatment of, e.g. vascular injury, cancers, fibrosis and neurodegeneration

Fibrosis and neurodegeneration

Claim 60; Page 85; 88pp; English.

Comprising a sequence encoding an inhibitory polypeptide containing at comprising a sequence encoding an inhibitory polypeptide containing at linked to a transcription regulator functional in eukaryotic cells; (11) comprising a sequence encoding a polypeptide that promotes endothelialisation, and (111) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are nucleic delivering the GCs to a cell for transfection. Also provided are nucleic collivaring the GCs to a cell for transfection. Also provided are nucleic collinar process when FP enters the cell, and (11) a transcellular collinar process when FP enters the cell, and (11) a transcellular consists of at least one CDK-binding motif and a TCP. See X26220 for consists of at least one CDK-binding a human truncated p27/pl6 fusion
                                                                                                                                                                                                                                                           Truncated p27/p16 fushor protein encoding DNA.

Truncated p27/p16 fushor protein encoding DNA.

MTS1; multiple tumour suppressor; diagnosis; cancer; germ-line mutation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA specific for Multiple Tumour Suppressor 1E1-beta gene - are useful for the diagnosis of cancers related to MTSIE1-beta mutation(s) and their treatment Disclosure; Column 61-62; 72pp; English.

This cDNA sequence encodes a human multiple tumour suppression protein, MTS1. The MTS gene locus is also referred to as the familial melanoma (MLM) gene locus, located on human chromosome 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum.

Claim 1; Column 61-62: 73pp; English.
This is the nucleotide sequence of the multiple tumour suppressor 1 (MTS-1) gene, used in the method of the invention. The MTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        04-DEC-1998 (first entry)
Nucleotide sequence of the CDS of the multiple tumour suppressor 1.
Multiple tumour suppressor 1; MTS-1; human; cancer; hybridisation; somatic mutation; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  P-PSDB; W74549.

Nucleic acids based on multiple tumour suppressor, MTS, sequences useful as hybridisation probes, primers and recombinant production of MTS in the diagnosis and treatment of cancers related to MTS
                                                                                                                                                                                                                                                                                           106

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   54
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             87
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of WTS. Recombinant WTS can be used to screen for drugs to be used for cancer therappy, and the protein litself may also be used to restore MTS function in a cell. Sequence 471 BP; 68 A; 153 C; 186 G; 64 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   03-FEB-1999 (first entry)

CDNA encoding a human multiple tumour suppressor 1 (MTS1) protein.

Human; multiple tumour suppressor 1 gene; MTS1; cancer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   106

Disclosures columns 63-66; 80pp; English.

The present sequence encodes a human multiple tumour suppressor 1 (MTS1) protein. The sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breathyroid, pancreas, uterus and kidneys.
